

Only the simplicial-encoder stack is strong on both axes

4,746 rows · 162 extractants · leave-extractants-out CV. Stacks use nested per-extractant weights. Dashed line = the repaired baseline (+0.2206), the level to beat. Adding the PI-CNN instead of the SNN does not move the stack (+0.2254 vs +0.2263), which is why the claim is about the simplicial encoder and not about 3D topology.
